Lower operating cost

end July 2016

# Content

- A350 Composite Technologies & Design
  - Overall design
- Certification & Testing approach
  - Regulatory & advisory material
  - Overall Full Scale Tests
- Key criteria for Maintainability

# Composites use in Airbus aircraft – growing

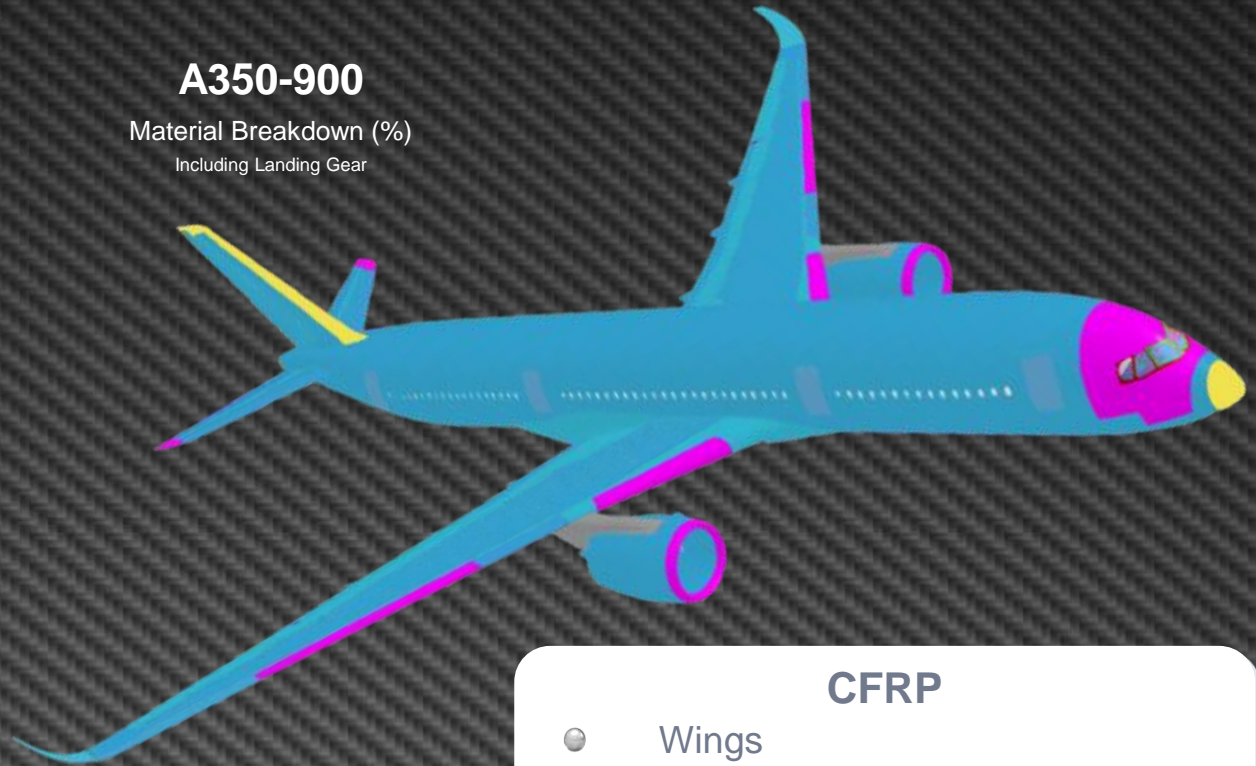

# A350XWB: The lighter Aircraft

## 70 % of advanced materials

**A350-900**  
Material Breakdown (%)  
Including Landing Gear

### Titanium

- High load frames
- Door surroundings
- Landing gear
- Pylons

### CFRP

- Wings
- Centre wing box and keel beam
- Empennage & Tail cone
- Fuselage Skin panels
- Frames, stringers and doublers
- Doors (Passenger & Cargo)

# Why Composite?

## Integration of functions

- Bonding replaces riveting
- Reduction of number of parts

## Fiber orientation to fit structural needs

- Better weight optimization
- Better stiffness control (wing shape)

## Reduced maintenance cost

- No need for specific corrosion (re-)protection
- No fatigue behavior

	1990	Today
Flight cycles	48.000	60.000
Scheduled Maintenance Tasks	4 years	12 years
Design Service Goal	20 years	30 years

## Higher residual value on 2nd hand market

- Major airlines renew fleets every 6-8 years
- Composite repairs / re-build without patches

# A350XWB – Composite Parts

# A350XWB: Composite Technologies & design Fuselage Status

**Panels / cobonded stringers**  
CFRP

**Pax Doors**  
CFRP

➔ Design for efficiency

# A350XWB: Wing Status Design for Performance

CWB

Single Droop Nose

7 Spoilers & 1 upper droop panel

6 Sealed slats

Winglet updated

Metallic Ribs

Engine pylon Attachment

# A350XWB: Wing Status

## Torsion Box – Top and Bottom Covers

**MSN1 WING COVERS**

- One piece Cover 32m long,
- Co-bonded process, ATL, pre-cured skin, Tee section stringers 'wet'
- Copper foil for lightning protection

# A350XWB Empennage Status

## Proven maturity

### HTP & VTP: Improved communality

Covers: Monolithic construction with "T" shape stringers

- Material : CFRP Tape ( ATL skins )
- Manufacturing process: Hard stringers co bonded to wet skins

*Root Joint : Continuous with tension bolts and Shear angles*

# A350XWB Structure & Technologies

## 3 keys challenges:

- Assess our Airbus “route of the art” with Composite technologies.
  - Certification rules ‘adapted’
  - Need new baseline and re-evaluation (Tail strike, ESN, crash..)
- Reduce Maintenance cost: 12 years maintenance target threshold
  - Fatigue & Corrosion free
  - Design robustness equivalent or better that A330 one
- Design for weight maintaining aggressive industrial ramp up.
  - New technologies with proven maturity (TRL&MRL,...)
  - Engineering & Manufacturing consolidation up to Extended Enterprise

 **Standardization was a must to ensure program objectives**

# Content

- *A350 Composite Technologies & Design*
  - *Overall design*
- **Certification & Testing approach**
  - **Regulatory & advisory material**
  - **Overall Full Scale Tests**
- *Key criteria for Maintainability*

# A350XWB CERTIFICATION & TESTING APPROACH

## Regulatory & Means of Compliance Basis updated for Composite Airframe Structure...

- Crash Survivability for Composite structure:
- Static, F& DT for Composite structure
- Post-crash fire resistance of CFRP materials:
- Lightning protection CFRP fuel tanks
- Rotor burst small fragment impact on CFRP fuel tank:
- Tyre debris for fuel tank Structural
- Substantiation of CFRP, Materials & manufacturing processes variability...

- Extensive use of established Standard to develop equivalent safety level:
- Building block approach for Tests
  - Advanced numerical computing methods

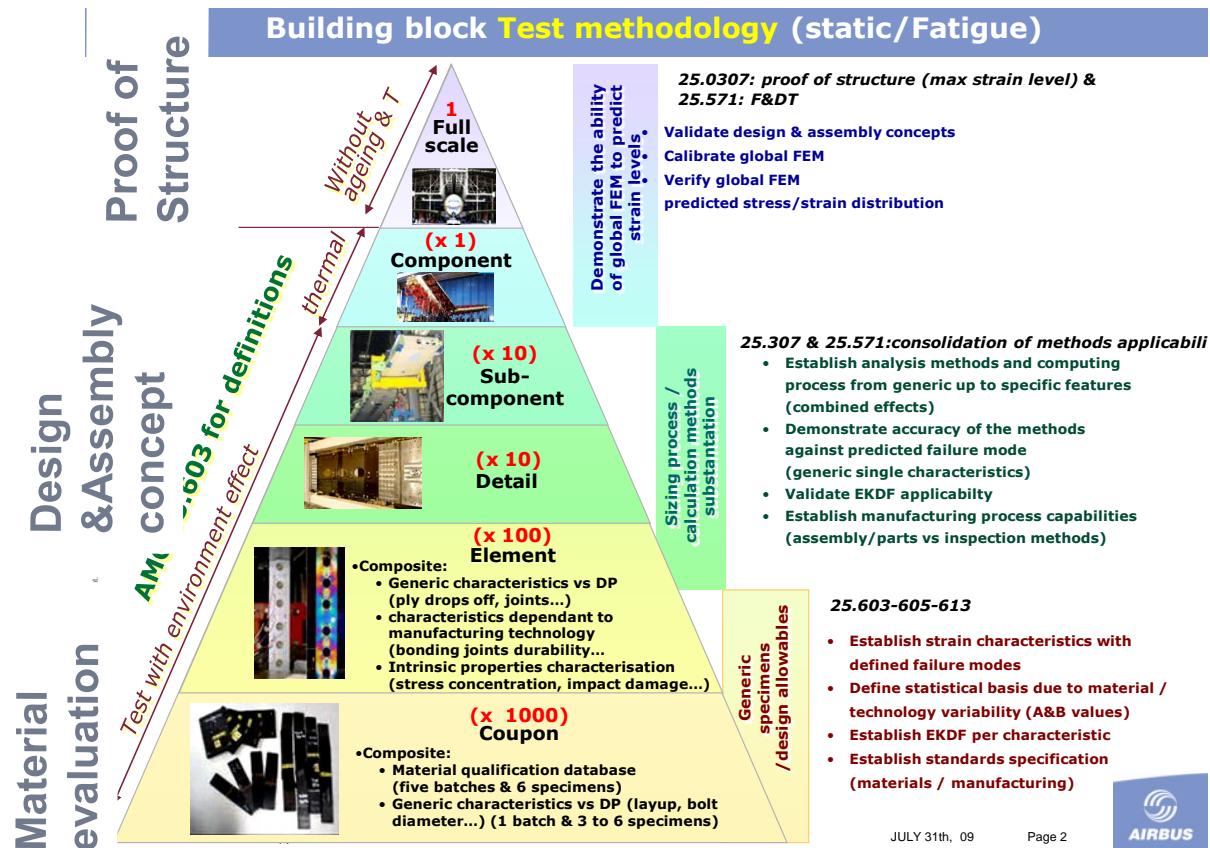

# CERTIFICATION & TESTING APPROACH

## Overall Approach

**CERTIFY [“Lat : CERTUM FACERE” – MADE CERTAIN ]**

➔ Tests methodology developed on a building block approach

- Block approach used to establish Composite sizing criteria & analysis process
- Comprehensive tests program developed for Wing & Fuselage design validation :

➔ **Large testing program developed**

# CERTIFICATION & TESTING APPROACH

## Large demonstrators methodology

- From Physical tests to Computer models
  - All physical tests (Details , Sub-component to demonstrators) are supported by computed models,
  - Extensive measurement on all test levels.
  - Verified predicted performance and understand combined load
- Objective is to have calibrated methods & computer models to run predictions' Virtual testing' in anticipation to full scale test: partial wing (EW), fuselage section (Barrels) and full aircraft (ES and EF)

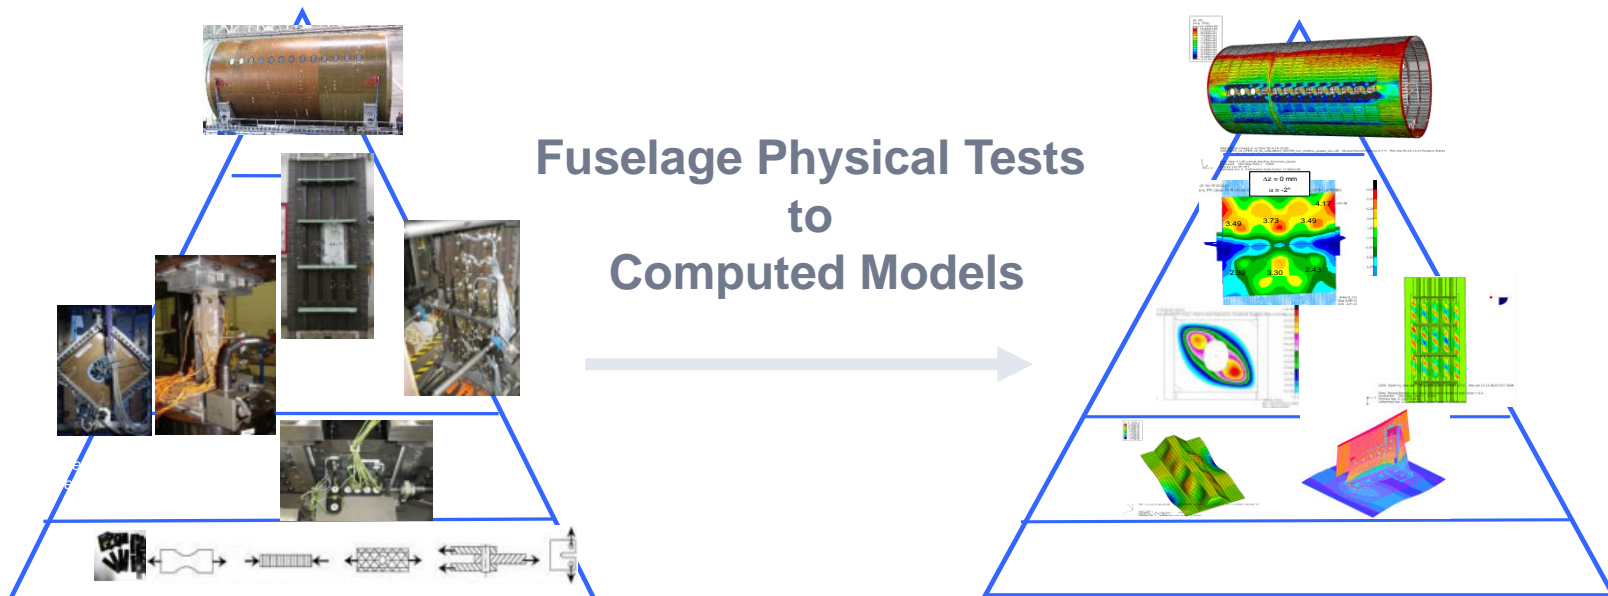

# CERTIFICATION & TESTING APPROACH

## Large demonstrators methodology

- From Physical tests to Computer models
  - All physical tests (Details, Sub-component to demonstrators) are supported by computed models
  - Extensive measurement on all test levels
  - Verified predicted performance and understand combined load
- Objective is to have calibrated methods & computer models to run predictions' Virtual testing' in anticipation to full scale test: partial wing (EW), fuselage section (Barrels) and full aircraft (ES and EF)

# CERTIFICATION & TESTING APPROACH

## Large demonstrators methodology

### Demonstrators developed when design concept doesn't encompass previous experience

- For Fuselage: 3 Barrels
  - 2 fuselage Demonstrators
  - 1 Pre-development test
- For Wing: 2 Outer Wing Box
  - 1 Wing Demonstrator test  
on top of A400M Wing & Partial wing Box tests  
& CWB test from A380
  - 1 Pre-development Wing Box (E-wing)
- For Empennage: 1 Root Joint Demonstrator  
for Vertical Fin joint attachment towards Tail cone

→ Consolidate Design , Modelling principles  
& Manufacturing processes

# CERTIFICATION & TESTING APPROACH

## Numerical Simulation

### Finite Element Modelling

Example: Virtual Full-Scale Test

- 68 million degrees of freedom
- Risk mitigation, secure static test campaign

# CERTIFICATION & TESTING APPROACH

## Full-Scale Fatigue Tests

### Nose Fuselage

#### Toulouse, France

Fatigue Campaign started  
22/10/13

>10.000 simulated flights achieved  
in May 2014

Test ended in Q4 2015

### Center Fuselage

#### Erding, Germany

Fatigue Campaign started 24/04/14

<1.000 simulated flights achieved in  
May 2014

Test ended in Q2 2016

### Rear Fuselage

#### Hamburg, Germany

Fatigue Campaign started 12/03/14

>5.000 simulated flights achieved  
in May 2014

Test ended in Q3 2015

# Content

- *A350 Composite Technologies & Design*
  - *Overall design*
- *Certification & Testing approach*
  - *Regulatory & advisory material*
  - *Overall Full Scale Tests*
- **Key criteria for Maintainability**

# A KEY CRITERIA FOR MAINTAINABILITY DESIGN&ROBUSTNESS EQUIVALENT TO A330

- Alu alloy
- CFRP Monolithic
- CFRP Sandwich
- Quartz, Glass

Improved performance and reduced maintenance with a big step as most of the external structure is in CFRP

# A KEY CRITERIA FOR MAINTAINABILITY

## Robustness

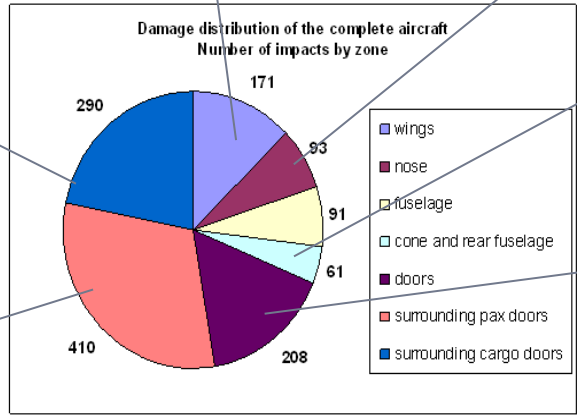

- Accidental dent assessment from in service data

- Statistical analysis for equivalent robustness between LR program

**77 Aircrafts**

**1324 impacts**

Number of impacts	Impacted zones
10	Engine
37	Wing
10	Flap
1	Adaptor
1	Wing tip
26	TRW Leading edge
10	Trailing edge
7	Door
1	Undamaged

- Aircraft zoning for impact resistance

- Translation of LR metal dents into A350XWB CFRP dent

# A KEY CRITERIA FOR MAINTAINABILITY

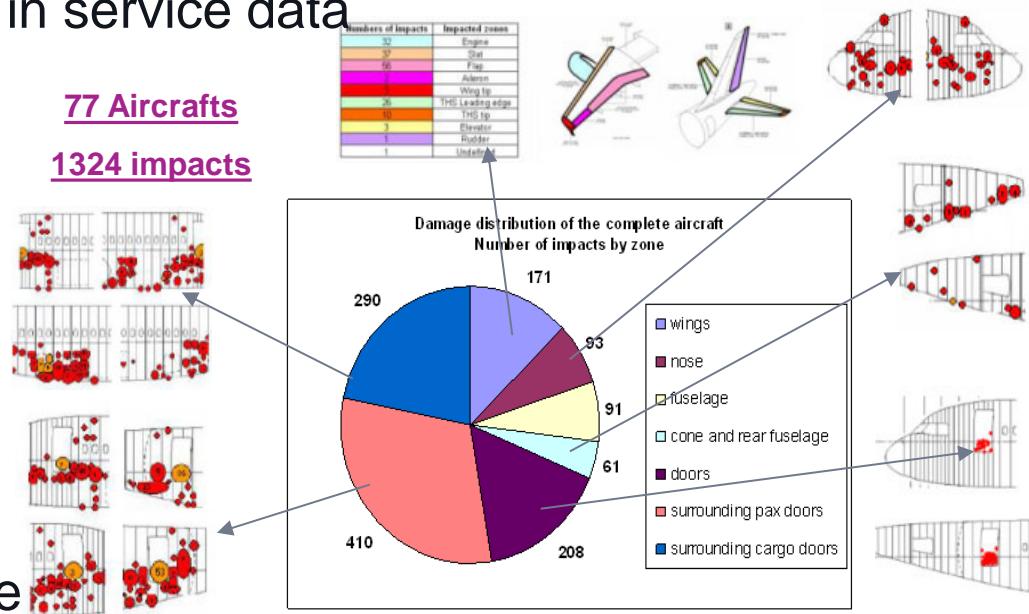

## Robustness

- Accidental dent assessment from in service data

- Statistical analysis for equivalent robustness between LR program

**77 Aircrafts**

**1324 impacts**

- Aircraft zoning for impact resistance

- Translation of LR metal dents into A350XWB CFRP dent

# A KEY CRITERIA FOR MAINTAINABILITY

## Robustness

### Ground Operation Risks

- Short turnaround times
- Simultaneous operations, multiple vehicles

### A350XWB Maintenance

- **-52%** structure tasks compared with A330
- Structure task interval significantly increased compared with A330
- **-45%** scheduled maintenance hours over heavy maintenance cycle (12 years) than on A330

# A KEY CRITERIA FOR MAINTAINABILITY

## Primary Structure Composite Repairs

Extensive experience to repair regardless whether it's metal or composite

- Majority of events involved secondary structure like belly fairing panels, nacelles...
- Primary structure
  - Empennages (since A300), ATR72 Wing, A380 Rear Fuselage
  - Example on Recent event of tail cone damage
    - Tail cone cut by winglet of passing aircraft
    - Repaired in situ

Repair definition,  
production and

embodiment in  
same time as for  
metallic structure

# A KEY CRITERIA FOR MAINTAINABILITY

## Primary Structural Bonded Repairs

### Concept

- **Flush Bonded repair** (permanent, no inspection) bonded repair on **Principal Structural Elements**.
- Current focus on most likely damage scenarios & locations:
  - **Fuselage skin** delamination and perforation.
  - **Fuselage stringer** delamination & disbond.
- **Selected repair material set**
  - Material selection & Qualification in the framework of the CACRC (Civil Aircraft Composite Repair Committee).

Fuselage shell. Lightning strike

Rear fuselage. Double curvature

Skin perforation and two stringers disbonded

Repair of impact damage on stringer head

# A KEY CRITERIA FOR MAINTAINABILITY

## Primary Structural Bonded Repairs

### Embodiement process

- **Environment conditions.** A/C in hangar. Preparation of prepreg plies in a humidity & temperature controlled environment.
- **Stepping** *either* by hand *or* with portable automated machining GSE
- **Curing.** Conventional hot bonder & heating blanket and single vacuum bag cover most damage scenarios & locations.
- **Checks & inspection:**
  - Water break test.
  - Conventional ultrasonic method.

Automated machining

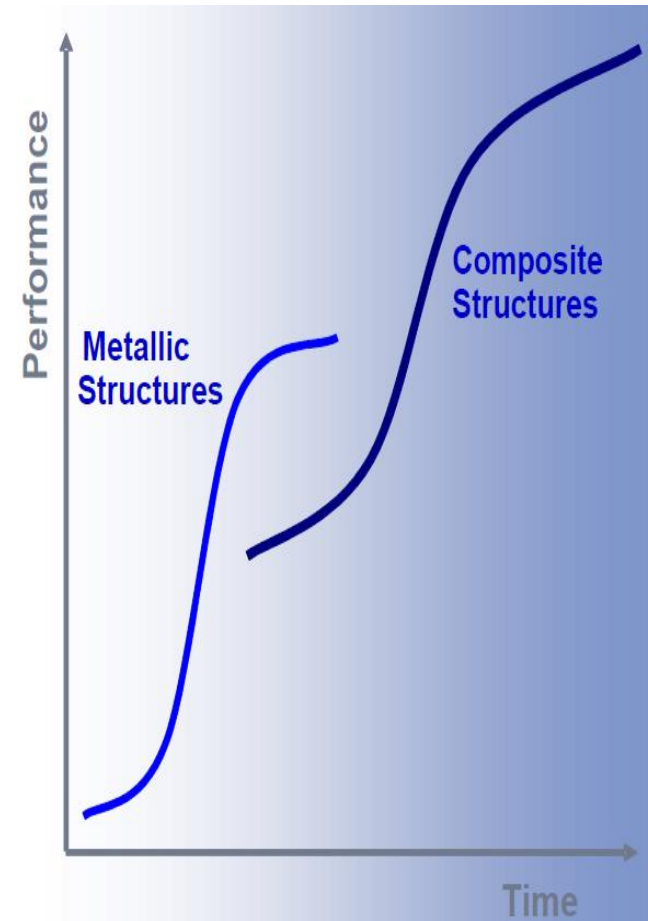

Repair patch curing set-up

Water break test

# Conclusions

- Airbus has accumulated a unique experience in Composite technologies. Especially the numerical simulation of composite structures has evolved significantly.
- The progressive introduction approach used by Airbus for new technologies and especially composites, in very close cooperation with the airlines, has proven to be very efficient.
- The in-service experience has validated the designs as well as the certification approach and the maintenance concept of these structure technologies.
- Many opportunities remain, composite not yet at “saturation level”.
